

AUDIENCE ANALYSIS ASSIGNMENT

Rafael Macchia

Miami Dade College

SPC 2608: Public Speaking

Professor Ruthie Stewart

October 1, 2026

Step 1: Identify Your Target Audience

The subject of this information speech is black hole formation and the processes happening near black holes. The target audience will be high school and early college students aged 16-22, who are interested in outer space, but do not have any kind of advanced knowledge of the subject. The audience is multicultural, consisting of males and females who are likely to be interested in such topics as space or science in a broad sense. The majority of them have probably heard about black holes and know that they possess high gravitational force but do not understand how they are formed and what is happening near the area of an event horizon.

Step 2: Understand Your Audience

Perhaps due to their fame and the mystery surrounding them, the audience is expected to have moderate to high interest in the topic of black holes. Because of the popularity of movies, social media, and many types of popular science discussions, the target audience is likely to have some previous exposure to the topic. It is expected that students have curiosity involving the process of black hole formation, whether black holes actually "suck" objects toward them, as well as the effects caused by their influence on nearby objects.

Most of those in the audience likely have a basic understanding of black holes already but probably are not familiar with astrophysics. They might be aware of the basic fact that nothing escapes from an event horizon but not familiar with other complex principles, such as stellar collapse, accretion disks, or extreme gravitational effects. Their attitude will probably be inquisitive or curious, although at the same time some of them might hold misconceptions based on popular media. For example, they might think that black holes work like vacuums and just

attract everything in their vicinity. That is exactly why concepts should be introduced to them in very clear terms and aimed at resolving misconceptions.

Step 3: Create an Audience Profile

The target audience consists mainly of teenagers and college students aged from 16 to 22 who possess various levels of scientific knowledge. They are interested in astronomy, space travel, physics, and other scientific fields. Psychographically, they may be interested in gaining knowledge, discovering new scientific facts, and understanding the universe as a whole. Some of them might want to learn about black holes because of their passion for science or science fiction, while others would just want to learn about one of the strange objects of the universe.

There are different thoughts and ideas that may come to the minds of the audience on the topic being discussed. Some students may feel that they find it difficult to understand the concept of black holes and that this is due to the fact that astrophysics requires a deep knowledge of higher-level concepts. Others may have misconceptions based on movies or posts they saw online. Some people may even ask about the need to study black holes since they seem to be too far from us. Since different people will have different background knowledge, I would take time to explain the main terms and concepts as opposed to assuming that everybody already understands everything.

Step 4: Craft a Thesis

By understanding how black holes come into being and what takes place around them, students can learn important science concepts while distinguishing scientific facts from myths surrounding black holes.
